the robot's own body: joint encoders, kinematic model, renderer, silhouette in the image
MEASURE
3 arm poses
camera pose: silhouette fit
joint offset: encoders
light, noise: body pixels
PREDICT
recover = ident x invert
ident: can the body
measure the change
invert: view kept after undo
UNDO
servo to the training pose
re-render into the
training camera
light map, denoise
VERIFY
warp the observed
silhouette into the
training view; kinematics
say where it must land
corrected frame
frozen policy: no weights change
